

QIF spiking network (microscale of NMM2 PING): TI realigns spike timing, not mean rate
 (black: E spikes; blue: population rate $r_E(t)$; red: TI envelope; boxed: envelope-locked timing, lock-in at Δf)

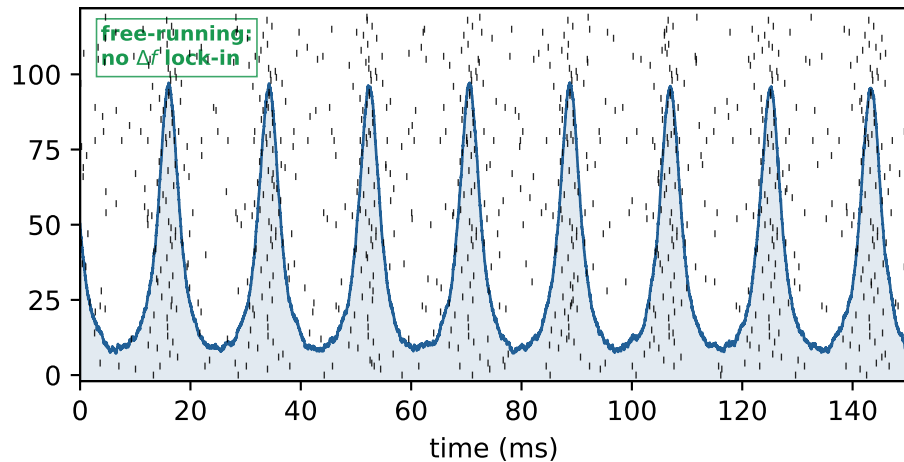

(a) Forced (below Hopf), TI OFF: asynchronous

(b) Forced, TI ON ($\Delta f=55$ Hz): timing bunched

(c) Entrained (above Hopf), TI OFF: free gamma

(d) Entrained, TI ON ($\Delta f=42$ Hz): gamma bursts gate to the TI beat
